

Setting up your Jupyter environment

Throughout this course, you will find several Jupyter Notebooks provided as downloadable resources within our video lectures. These notebooks are packed with live code that Laurence uses in the lectures. To make the most out of these resources, it's essential to set up a Jupyter environment on your computer or use [our Python environment](#). In case you want to run the codes in your local machine, this guide will walk you through the process of installation and setup on Windows, macOS, and Linux systems.

Step 1: Install Python

Jupyter requires Python to be installed on your system. We recommend installing Python through the Anaconda distribution, which includes Python, the Jupyter Notebook, and other commonly used packages for scientific computing and data science.

1. Go to the Anaconda website: <https://www.anaconda.com/products/distribution>
2. Download the installer for your operating system.
3. Follow the installation instructions on the website for your OS.

Step 2: Install Jupyter Notebook

If you have chosen not to use Anaconda, you can install Jupyter using Python's package manager, pip.

Windows, macOS, and Linux:

1. Open your terminal (Command Prompt for Windows, Terminal for macOS and Linux).
2. Install Jupyter by entering the following command: `pip install notebook`

Step 3: Running Jupyter Notebook

1. Open your terminal or Command Prompt.
2. Enter the following command: `jupyter notebook`
3. This command will start the Jupyter Notebook server and open your default web browser to the Jupyter interface.

Step 4: Opening a Jupyter Notebook

1. In the Jupyter Notebook interface, navigate to the folder where you have saved the notebook files you will download as Laurence provides in the lectures. You can typically find these files under the "Download" tab mentioned in some of Laurence's video lectures.
2. Click on a notebook file (with a `.ipynb` extension) to open it.

We hope this guide helps you set up your Jupyter environment with ease.
